

SME Operating Agent

Business Proposal

Know the company. Act on meetings. Grow the team.

Hackathon proposition

One integrated agent that helps Stellar Ark AI employees recover company context, convert meeting decisions into controlled follow up, and support founder-led recruiting.

Executive Summary

Stellar Ark AI builds AI-native wearables, including context glasses and a pendant, paired with a proactive agent system that turns everyday conversations into persistent memory and action. Its agent layer connects to Feishu, email, calendar, and CRM for customers in consulting, finance, legal, enterprise sales, and technology.

The company faces a related internal challenge: employees must recover knowledge from scattered records, translate meeting decisions into accountable work, and support hiring while continuing core product and customer responsibilities. These are connected failures in the path from context to action.

The SME Operating Agent joins three working surfaces into one business story. Company Context provides evidence-backed answers and uses Personal Memory to retain employee-specific context across interactions. Personal Memory remains separate from the company records used to support factual claims. Meeting Actions turns text transcripts into traceable decisions and controlled follow up. Recruiting helps a founder define criteria, review candidates, and prepare outreach.

One Business Story

Know	Act	Grow
Recover company context from inspectable evidence	Turn meeting decisions into controlled follow up	Run structured founder-led recruiting

Why It Fits Stellar Ark AI

Stellar Ark AI already builds systems that turn captured context into memory and action for customers. This proposal applies the same product principle to the company's own knowledge, meeting execution, and hiring workflows while preserving evidence, privacy, and human control.

Problem and Opportunity

Who Experiences the Problem

The primary users are Stellar Ark AI employees and founders who must turn fragmented company information into daily work inside a fast-moving AI-native product business. Managers and governance owners also need reliable sources, clear permissions, and visible accountability.

Current Workflow and Consequence

Current task	Manual friction	Business consequence
Answer a company question	Search several systems and reconstruct the history	Slower answers and decisions based on incomplete context
Follow up a meeting decision	Interpret notes, gather details, draft work, and remember ownership	Actions may be delayed, duplicated, or missed
Run founder-led hiring	Define criteria, search profiles, compare candidates, and chase replies	Recruiting competes with product, customer, and leadership work

Why This Opportunity Matters

- The same scarce employees repeatedly reconstruct context before they can act.
- Meeting follow through and hiring are high-value workflows where visibility and human judgment matter.
- A shared evidence and control layer can support several workflows without silently automating consequential decisions.

Evidence Used for the Hackathon

The workflows reflect the team's first-hand experience at Stellar Ark AI. To protect confidential company and customer information, the demonstration uses OrgForge synthetic workplace records rather than private business data. OrgForge is demonstration data, not a customer, dependency, deployment target, or integration.

Proposed Solution

Workflow	Employee experience	Business result
Company Context	An employee asks a company question and receives a concise answer with inspectable Company Evidence. Personal Memory carries employee-specific context across interactions without becoming factual evidence	Less time searching across systems and greater confidence in the source of an answer
Meeting Actions	An employee provides a text transcript. The agent identifies commitments, questions, and decisions, checks relevant context and conflicts, and prepares follow-up for review	Faster follow through, clearer ownership, and fewer actions lost after a meeting
Recruiting	A founder defines a role, reviews scored public profiles and feedback, and receives outreach and follow-up drafts before completing the handoff	Less recruiting administration and more founder time for product, customers, and leadership

The workflows connect through the work itself. Company context can support meeting follow-up, and an approved hiring need can become a recruiting draft. Employees can inspect the supporting information and decide whether to complete each consequential handoff.

Business Value and Outcomes

Value area	Expected value	Success measure
Productivity	Less time reconstructing context and converting it into work	Compare median handling time and manual steps before and after
Follow through	Visible, traceable commitments instead of reliance on memory	Measure time to draft, completion rate, and overdue actions
Hiring capacity	A structured candidate and follow-up workflow for the founder	Measure founder administration time per active role
Service quality	Inspectable evidence and an explicit insufficient-evidence outcome	Review correctness, expected-evidence recall, and source usability
Risk control	Deterministic approval, escalation, blocking, and user-controlled handoffs	Count approval bypasses, unsafe content failures, and unauthorised sends

Expected Impact

Outcome	Decision threshold
Faster context reconstruction	At least 30 percent below baseline median time
Less meeting administration	At least 50 percent below baseline time to a reviewable draft
Better follow through	At least 90 percent of accepted actions completed by their due date
Lower founder hiring effort	At least 25 percent below baseline administration time
Human control	Zero unauthorised outbound sends or executed escalated actions

These targets define what business success should look like after deployment. A baseline measurement will be taken before the solution is introduced so that the team can compare time, completion, and control outcomes fairly.

Feasibility and Scalability

Prototype Proof

Workflow	What the prototype demonstrates	Why it is feasible
Company Context	A browser workflow searches 4,966 employee-visible synthetic artifacts across eight workplace record types and returns inspectable citations or an insufficient-evidence response	PostgreSQL, pgvector, explicit artifact links, source validation, and employee-scoped Personal Memory are already implemented
Meeting Actions	A text transcript becomes structured commitments, questions, decisions, conflict checks, and reviewable follow-up	Deterministic policy checks, evidence lookup, exact-payload approval, and action logs provide a controlled execution path
Recruiting	A founder can define criteria, review and score public profiles, record feedback, and prepare outreach	The implemented service supports search, scoring, proposals, outreach drafts, retention, and user-controlled handoff

Path to Scale

1. Start with one Stellar Ark AI team, approved company sources, a recurring meeting workflow, and one active hiring role.
2. Connect sanctioned workplace systems and add tenant permissions, retention, monitoring, and operating support.
3. Expand across teams and transaction volumes after the solution meets the business success measures.

Company Evidence remains separate from employee Personal Memory, and consequential outbound actions continue to require a visible employee decision. Access controls and monitoring can be strengthened as usage expands.

Closing Case

The SME Operating Agent gives Stellar Ark AI one connected way to recover company knowledge, turn meeting decisions into accountable work, and support founder-led hiring. It applies the company's own context-to-action product principle to internal operations and demonstrates the full story through working browser workflows. The result is a practical foundation for faster execution as the company grows, with evidence and employee judgment preserved where they matter.
