

SME Operating Agent

Business Proposal

Know the company. Act on meetings. Grow the team.

Hackathon proposition

Stellar Ark AI applies its own context-to-action principle internally: one operating agent that carries company evidence into meeting follow-up and structured hiring.

Executive Summary

Stellar Ark AI builds AI-native wearables and a proactive agent system that turn everyday conversations into persistent memory and action. Yet inside a growing company, work can still fragment across company records, meeting notes, and founder-led hiring. Every manual handoff competes with product development, customer delivery, and leadership time.

The SME Operating Agent closes that internal gap. It carries work through one connected loop: recover reliable context, turn meeting decisions into accountable follow-up, and open a structured recruiting workflow when the company needs additional capacity.

Company Context answers questions from inspectable evidence while Personal Memory retains employee-specific context across interactions without becoming factual evidence. Meeting Actions converts text transcripts into reviewable commitments and decisions. Recruiting turns an approved hiring need into criteria, candidate review, and outreach drafts. Employees remain responsible for consequential external actions.

One Operating Loop

Context	Decision	Action	Growth
Recover inspectable company evidence	Extract commitments and decisions	Prepare owned follow-up	Start structured hiring when needed

Why It Fits Stellar Ark AI

The proposal applies Stellar Ark AI's own product principle to internal operations. The same idea that serves customers - captured context becoming useful memory and action - becomes an operating advantage for the team building it.

Problem and Opportunity

Who Experiences the Problem

The primary users are Stellar Ark AI employees and founders who must turn fragmented company information into daily work while continuing to build products and serve customers. In a small team, time spent reconstructing history, rewriting meeting notes, or coordinating hiring directly reduces execution capacity.

Current Workflow and Consequence

Current task	Manual friction	Business consequence
Answer a company question	Search several systems and reconstruct the history	Slower answers and decisions based on incomplete context
Follow up a meeting decision	Interpret notes, gather details, draft work, and remember ownership	Actions may be delayed, duplicated, or missed
Run founder-led hiring	Define criteria, search profiles, compare candidates, and chase replies	Recruiting competes with product, customer, and leadership work

Why This Opportunity Matters

- Employees can move from a supported answer to meeting follow-up without reconstructing the same context twice.
- Decisions, owners, and due dates become visible work rather than information left in notes.
- Founder-led hiring becomes a repeatable process instead of another workflow rebuilt for every role.

Evidence Used for the Hackathon

The workflows reflect the team's first-hand experience at Stellar Ark AI. To protect confidential company and customer information, the demonstration uses OrgForge synthetic workplace records rather than private business data. OrgForge is demonstration data, not a customer, dependency, deployment target, or integration.

Proposed Solution

Workflow	Employee experience	Business result
Company Context	An employee asks a company question and receives a concise answer with inspectable Company Evidence. Personal Memory carries employee-specific context across interactions without becoming factual evidence	Less time searching across systems and greater confidence in the source of an answer
Meeting Actions	An employee provides a text transcript. The agent identifies commitments, questions, and decisions, checks relevant context and conflicts, and prepares follow-up for review	Faster follow through, clearer ownership, and fewer actions lost after a meeting
Recruiting	A founder defines a role, reviews scored public profiles and feedback, and receives outreach and follow-up drafts before completing the handoff	Less recruiting administration and more founder time for product, customers, and leadership

The workflows connect through the work itself. Company context can support meeting follow-up, and an approved hiring need can become a recruiting draft. Employees can inspect the supporting information and decide whether to complete each consequential handoff.

Business Value and Outcomes

Workflow	Business value	Initial success target
Company Context	Employees spend less time reconstructing history and can inspect the records supporting an answer	At least 30 percent reduction in median time to an evidence-backed answer
Meeting Actions	Decisions become owned, reviewable follow-up instead of remaining in meeting notes	At least 50 percent reduction in time to a reviewable draft, with 90 percent of accepted actions completed by their due date
Recruiting	The founder can compare candidates and prepare outreach without rebuilding the process for each role	At least 25 percent reduction in founder administration time per active role

How Impact Will Be Measured

The targets are working assumptions based on the team's SME context, not achieved results. Before deployment, Stellar Ark AI would record baseline handling time, manual steps, overdue actions, and founder administration time for representative work. The same measures would then be collected after introduction of the agent so that business impact is attributable and comparable.

Human control is a non-negotiable operating measure: the solution should produce zero unauthorised outbound sends or executed escalated actions.

Feasibility and Scalability

Prototype Proof

Workflow	What the prototype demonstrates	Why it is feasible
Company Context	A browser workflow searches 4,966 employee-visible synthetic artifacts across eight workplace record types and returns inspectable citations or an insufficient-evidence response	PostgreSQL, pgvector, explicit artifact links, source validation, and employee-scoped Personal Memory are already implemented
Meeting Actions	A text transcript becomes structured commitments, questions, decisions, conflict checks, and reviewable follow-up	Deterministic policy checks, evidence lookup, exact-payload approval, and action logs provide a controlled execution path
Recruiting	A founder can define criteria, review and score public profiles, record feedback, and prepare outreach	The implemented service supports search, scoring, proposals, outreach drafts, retention, and user-controlled handoff

Path to Scale

1. Start with one Stellar Ark AI team, approved company sources, a recurring meeting workflow, and one active hiring role.
2. Connect sanctioned workplace systems and add tenant permissions, retention, monitoring, and operating support.
3. Expand across teams and transaction volumes after the solution meets the business success measures.

Company Evidence remains separate from employee Personal Memory, and consequential outbound actions continue to require a visible employee decision. Access controls and monitoring can be strengthened as usage expands.

Closing Case

Stellar Ark AI already believes that conversations should become durable memory and action. This proposal turns that belief into an internal operating advantage. The SME Operating Agent carries inspectable context into meeting follow-up and structured hiring, giving a small team more execution capacity without removing employee judgment. The working prototype demonstrates the core loop today and provides a practical foundation for expansion as the company grows.
